An Introduction to Boundary Layer Meteorology | Roland B ...

In physics and fluid mechanics, a boundary layer is the layer of fluid in the immediate vicinity of a bounding surface where the effects of viscosity are significant. In the Earth's atmosphere, the atmospheric boundary layer is the air layer near the ground affected by diurnal heat, moisture, or momentum transfer to or from the surface.

This textbook introduces a set of fundamental equations that govern the conservation of mass (dry air, water vapor, trace gas), momentum and energy in the lower atmosphere. Simplifications of each of these equations are made in the context of boundary-layer processes.

The unstably-stratified ABL, or convective boundary layer (CBL), occurs when strong surface heating (due to the sun) produces thermal instability or convection in the form of thermals and plumes, and when upside-down convection is generated by cloud-top radiative cooling.

An Introduction to Boundary Layer Meteorology: Stull ...

The boundary layer concept was invented at the beginning of the twentieth century (i.e., about hundred years ago). At that time, this very inspired approximation of Navier-Stokes equations appeared as a breakthrough in aerodynamics and opened the doors to new knowledge. It has been said that the boundary layer was the key to aerodynamics.
