...

The skeletal system includes all of the bones, cartilages, and ligaments of the body that support and give shape to the body and body structures. The skeleton consists of the bones of the body. For adults, there are 206 bones in the skeleton. Younger individuals have higher numbers of bones because some bones fuse together during childhood and adolescence to form an adult bone.

Divisions of the Skeletal System | Anatomy and Physiology I

Bone, or osseous tissue, is a hard, dense connective tissue that forms most of the adult skeleton, the support structure of the body. In the areas of the skeleton where bones move (for example, the ribcage and joints), cartilage, a semi-rigid form of connective tissue, provides flexibility and smooth surfaces for movement.

Functions of the Skeletal System | Anatomy and Physiology

The human skeleton contains 206 known bones and because of its sheer scope, a classification system had to be invented. Typically, bones are classified into four categories by shape: long, short, flat, and irregular. The skeleton is again classified into smaller and more specific groups which we'll discuss in future publications.

Anatomy & Physiology - Simple Book Publishing

The science of physiology often studies the functions of different body parts or organ systems of a living creature. In this light, the physiology of the skeletal system can be enumerated in five words: shape, support, protection, storage, and movement. These functions apply both to the human body and almost all animals categorized as vertebrates.
