This current varying in parallel circuits brought about Kirchoff's next big law in basic electrical engineering, Kirchoff's Current Law (KCL). This law basically states that current into a node will equal the current out of the node. In other words, the net current in a node is zero or $0 = I(\text{in}) - I(\text{out})$.

Average Load Formula - Basics of Electrical Engineering

For example: An over current protection device, such as a fuse or a circuit breaker, must be sized no less than 125% of the continuous load. For a load that is 80A, the over current protection device can not be sized less than 100A. To get this answer, we convert 125% to 1.25 and multiply $80 \times 1.25 = 100A$.
