movements through only allowing trains to receive authority to proceed, when routes have been set, lock and detected in safe combinations. The main function carried out by an interlocking system is to set and lock routes related to each train located in an area under its responsibility, in order to ensure safe movements along the track.

Zone Selective Interlocking (ZSI) is a communication scheme used with electronic trip units and electronic protective relays for circuit breakers to improve the level of protection in a power distribution system. This is achieved through
